Tracks

Only uphill scale is considered

MTBSU=0

Graveled or hardened earth. Good grip. Even unskilled mountainbikers can ride up here easily. Cars with good tire clearance can go down or up without problems.

MTBSU=1

Graveled or hardened earth. Good grip so wheelspin (also when standing) does not happen when taking care. Steep forest track or easy to ride footpath.

MTBSU=2

Mostly stable, unsurfaced, partly washed out, steady pedalling and ballance needed. With good technique and reasonable fitness this should be still doable however

MTBSU=3

Variable Surface, tight corners, small steps, surface is rocks, earth or grass. Very good balance and steady, round pedalling needed. Without very good skills mtbikers have to push their bike uphill

MTBSU=4

Way is very steep, or in bad condition for pedalling uphill. Steps, trees, roots and tight corners are present and even good and strong mountainbikers will have to push or carry their bike for parts of the way

MTBSU=5

Way is too steep and/or difficult to ride uphill.

Tracktype of unknown grade

Paths Uphill scale shown with dashes up to MBTS=3

MTBSU=0-1 MTBSU=2 MTBSU=3 MTBSU=4-5

MTBS=0

Gravel or packed earth. No particular difficulties. Mostly forest and meadow paths (highway=path). Sections with steps, rocks, or roots are not expected. Wide curves, easy to moderate slope. No special skills are needed to ride this. Easy to ride uphill.

MTBSU=0-1 MTBSU=2 MTBSU=3 MTBSU=4-5

MTBS=1

Smaller obstacles like roots and small stones. Erosion damage may increase difficulty. Soil may be loose in places. Tight turns, but no hairpin turns. Riding requires care and attention, but no special skill. Obstacles can be ridden over. Difficult to ride uphill.

MTBSU=0-1 MTBSU=2 MTBSU=3 MTBSU=4-5

MTBS=2

Obstacles such as large rocks and stones. Soil is often loose. Steps are expected. Wider hairpin turns, steepness of up to 70%. Requires some advanced riding skills. Only very skilled riders can go uphill on this.

MTBSU=0-1 MTBSU=2 MTBSU=3 MTBSU=4-5

MTBS=3

Many sections with large obstacles such as boulders and large roots. Many hairpin and off-balance turns. Slippery surface and talus sections may be found. The surface may be very slippery. Constant concentration and very good skills needed. Nearly impossible to ride uphill.

MTBS=4

Very steep and difficult, with sections having large boulders and roots. Frequent loose debris. Very steep sections with very tight hairpin turns and high steps that will cause the chainring to hit the ground. Some trials techniques will be necessary. Nearly impossible to ride uphill.

MTBS=5

Very steep and difficult with big boulder fields and debris, and landslides. Speed must be carried for counter-ascents. If at all only short passages are available for accelerating and braking. Fallen trees may make very steep passages even more difficult. Very few Mountainbikers can actually ride at this level. Most will have to push.

MTBS=6

Ways that are not rideable at all for a mtbiker. E.g. Chains or stemples (metal rungs) on a via ferrata or simply unsecured alpine paths that are not even partly rideable for the very best mtbikers (using trial techniques). Steepness is often >45°.
